## Learning outcomes

We are often faced with questions concerning our finances: Am I saving enough to put my daughter through college? How much will my investment be worth five years from now? Should I pay down my mortgage with weekly or monthly payments? The mathematics of finance allows us to answer these and similar questions.

Upon completion of this Module, you should be able to:

- use the simple interest formula to calculate the interest, the principal, the annual interest rate, or the time
- explain the difference between simple and compound interest
- find the compound amount using the compound interest formula
- calculate the present value of a compound amount using a formula
- calculate the effective interest rate using a formula
- calculate ordinary annuities using a formula
- calculate annuity payments using a formula
- calculate loan payments and mortgage payments using a formula
- use tables to determine the annual interest rate on a loan

## Procedure for independent study

1. Read each of the units in order and complete all of the exercises. If you need assistance, contact your instructor.
2. Study the terminology in the Glossary to become familiar with the definitions.
3. If recommended by your instructor, complete additional problem sets.
4. Complete the Review Questions.

## Glossary

## Annual interest rate

The interest rate over a one year period or interest rate per annum.

## Annuity

A series of equal payments at regular intervals.

## Annum

Referring to one year.

## Balance

The amount remaining after a sequence of transactions.

## Bond

A note to pay the holder both the principal and interest due on the maturity date.

## Canada Savings Bond (abbreviated C.S.B.)

A bond issued by the government of Canada.

## Capital gain

The amount by which an investment increases over a period of time.

## Capital loss

The amount by which an investment decreases over a period of time.

## Compounding

The process of periodically calculating the interest earned on the principal and adding this amount to the principal.

## Compound interest

The amount of interest earned after calculating the interest on the previous principal plus interest earned.

## Compounding period

The time period between successive calculations and conversions of interest to principal.

## Dividend

A payment, usually quarterly, made to the owners of certain stocks.

## Effective interest rate

The interest rate which reflects the total amount of interest earned on an investment in one year.

## Finance charge

The total interest paid for a loan or mortgage. The sum of the periodic payments minus the amount of the loan or mortgage.

## Gross income

The amount of money earned before deductions.

## Interest

The fee lenders charge to borrowers for the temporary use of money.

## Interest rate

The percentage charged or earned for the use of money per year.

## Loan

Money lent for a fixed period of time.

## Maturity date

The date on which the loan (principal plus interest) is due, or the date on which an investment (principal plus interest) is payable.

## Mortgage

Loans made for the purchase of homes and other real estate property.

## Mutual fund

An investment fund composed of a selection of various stocks and bonds.

## Net income

The amount remaining after deductions are subtracted from gross income.

## Nominal interest rate

The stated annual interest rate.

## Present value

The starting principal or amount required to obtain a specific amount in the future.

## Principal

The original amount of a loan or an investment.

## Quarterly

Four times a year.

## Semi-annually

Twice a year.
Share
An investment that is a part ownership in a corporation.

## Simple interest

Interest calculated only on the original principal amount and paid only at the maturity date.

## Term

The time period for which a loan or investment is made.

## Variable

A symbol, usually a letter, used to represent a value in an equation or a formula.

## Unit 1: Simple interest

Interest is the price paid for the use of money. If you borrow money from another person or a bank, eventually you must pay back this amount plus the interest owing. When you deposit money in a bank, you are lending them money and after some time they will pay you interest on the money you lent them.

The amount of money that you lend or borrow is called the principal. The amount of interest you will owe or receive is determined by the interest rate. This interest rate is given as a percent. Interest rates are quoted for periods of 1 year. For example, if you deposit $\$ 100$ in a savings account paying $3 \%$ interest, then 1 year later you will have earned $\$ 3$ in interest.

Simple interest is defined as the product of the principal $(P)$, the rate $(r)$, and the time $(t)$.

## Example 1

Jo deposits $\$ 200$ in a savings account paying 5\% per year. How much interest will she receive after one year?

## Solution

Identify the $P$, $r$, and $t$.
Here, $P=\$ 200 \quad \mathrm{I}=$ Prt
$r=5 \%$ or $0.05 \quad \mathrm{I}=200(5 \%)(1) \quad$ Replace $P, r$, and $t$ with their values
$t=1$ year $\quad \mathrm{I}=200(0.05)(1) \quad$ Change $5 \%$ to its decimal equivalent, 0.05
$\mathrm{I}=10 \quad$ Multiply $200 \times 0.05 \times 1$
Jo will receive \$10 in interest.
Simple interest is calculated solely on the principal investment or loan. It is calculated only once, depending on when the investment or loan is due.

## Example 2

Linda lends Ed $\$ 500$. Ed says he will pay her back in 60 days at $9 \%$. How much interest should Linda receive? How much must Ed pay Linda altogether?

## Solution

$$
\begin{array}{lll}
P=\$ 500 & \mathrm{I}=P r t \\
r=9 \% \text { or } 0.09 & \mathrm{I}=500(0.09)\left(\frac{60}{365}\right) & \text { Replace } P, r, \text { and } t \text { with their values } \\
t=60 \text { days }=\frac{60}{365} \text { years } & \mathrm{I}=7.39726 & \text { Multiply } \\
& \mathrm{I}=\$ 7.40 & \text { Round to the nearest cent }
\end{array}
$$

Linda should receive $\$ 7.40$ in interest.
Ed owes Linda $\$ 500+\$ 7.40=\mathbf{\$ 5 0 7 . 4 0}$ altogether.

## Example 3

The amount of interest earned on a Canada Savings Bond is determined by the number of months between purchase and redemption date.

If Sid purchased an $\$ 800$ C.S.B. at $3.75 \%$ on November 1, 2000 and redeemed it on May 31, 2001, how much interest should he receive?

## Solution

Sid held the bond for 7 full months.

$$
\begin{array}{lll}
P=\$ 800 & \mathrm{I}=\operatorname{Prt} \\
r=3.75 \%=0.0375 & \mathrm{I}=800(0.0375)\left(\frac{7}{12}\right) & \text { Replace } \mathrm{v} \\
t=7 \text { months }=\frac{7}{12} \text { years } & \mathrm{I}=17.50 & \text { Multiply }
\end{array}
$$

Sid will receive $\mathbf{\$ 1 7 . 5 0}$ in interest.

## Exercise 1

1. a. How many days in 1 year?
b. How many weeks in 1 year?
c. How many months in 1 year?
2. Calculate the interest earned in each of the following.
a. $\$ 1000$ at $10 \%$ for 1 year
b. $\$ 150$ at $5 \%$ for 1 year
c. $\$ 500$ at $4.5 \%$ for 0.5 years
d. $\$ 200$ at $11 \%$ for 0.25 years
e. $\$ 100$ at $7 \%$ for 6 months
f. $\$ 50$ at $6 \%$ for 8 months
g. $\$ 2500$ at $6 \frac{1}{2} \%$ for 100 days
h. $\$ 1000$ at $5.25 \%$ for 30 weeks
3. Mike borrowed $\$ 1500$ from his mother. He agreed to pay her back in 9 months at $5 \%$. How much interest will he owe her and how much will he owe altogether?
4. Mark bought some R.O.C.K. shares valued at $\$ 4$ per share. After 1 year, the share had a loss of $18 \%$ per share. How much did each share lose and what is one share now worth?
5. Barb invested $\$ 100$. At the end of one year the investment had earned $16 \%$. She then invested the whole amount (principal plus interest) and earned $12 \%$ in the second year.
a. How much interest did Barb earn at the end of the first year?
b. How much did she invest at the beginning of the second year?
c. How much interest did she earn in the second year?
d. Over the two year period, how much interest did Barb earn?
6. Larry loaned Mary $\$ 250$ at $7 \%$. Mary said she would pay Larry the $\$ 250$ plus interest in 90 days. What is the total amount of money that Mary should pay Larry in 90 days?
7. A certain $\$ 5000$, five-year bond earns $5.5 \%$. The bond pays interest twice a year (semi-annually).
a. How much interest will the bond earn after 6 months?
b. What is the total amount of interest the bond will earn at the end of 5 years?

Answers are on page 65.

## Unit 2: Variations on simple interest

Simple interest is used to determine the amount of interest earned on an investment or due on a loan.

Investors might ask:

1. How much principal do I need in order to earn so much interest over a certain period of time?
2. What interest rate do I need in order to earn so much interest over a given time period?
3. How much time will it take in order to earn so much interest at a given rate of return?

These questions can be answered by solving the simple interest formula, $\mathrm{I}=P r t$, for $P$, or $r$ or $t$.

| To determine the principal use | $P=\frac{\mathrm{I}}{r t}$ | where | $P=$ principal <br> $\mathrm{I}=$ interest <br> To determine the interest rate use <br> To determine the time use |
| :--- | :--- | :--- | :--- |
|  | $r=\frac{\mathrm{I}}{P t}$ |  | $r=$ annual interest |
|  | $t=\frac{\mathrm{I}}{P r}$ | rate |  |
|  |  | $t=$ time (in years) |  |

The following memory aid is often called the "Magic Triangle", because if you cover the variable you are trying to find, the formula will magically appear!

## Example 1

Cover the I and

## Example 2

Cover the $r$ and

## Example 3

A six month investment will earn $5.25 \%$. How much would you need to invest if you want to earn $\$ 100$ in interest?

## Solution

The principal is unknown. Cover $P$ in the Magic Triangle.

$$
I=\$ 100
$$

$$
r=5.25 \%=0.0525
$$

$$
t=6 \text { months }=\frac{6}{12} \text { or } 0.5 \text { years } \quad P=\frac{100}{0.0525(0.5)}
$$

Replace $\mathrm{I}, r$, and $t$ with their values

$$
P=\frac{100}{0.02625} \quad \text { Multiply } 0.0525 \times 0.5
$$

$$
P=3809.52
$$

Divide 100 by 0.02625 and round answer to the nearest cent

You would need to invest $\mathbf{\$ 3 8 0 9 . 5 2}$

|  | 100 |
| :---: | :---: |
|  | To calculate $P=\frac{100}{0.0525(0.5)}$, press |
|  | $100 \triangle \div \square 0.0525 \boxed{\times} 0.5 \boxed{\square} \boxed{\square}$ |
| Calculator Tip | Did you get 3809.52381 ? |

## Example 4

Mariko had $\$ 240$ in the bank for the month of April. At the end of the month she had earned $\$ 0.90$ in interest. What interest rate was the bank paying?

## Solution

The interest $r=$ ? or

$$
\begin{array}{lr}
P=\$ 240 & r=\frac{0.90}{240\left(\frac{1}{12}\right)} \\
\mathrm{I}=\$ 0.90 & \\
t=1 \text { month }=\frac{1}{12} \text { year } & r=\frac{0.90}{20}=0.045
\end{array}
$$

The interest rate is $\mathbf{4 . 5 \%}$
$\square$

## Example 5

Carol invested $\$ 500$ paying $6 \%$. How long will it take her to earn $\$ 250$ in interest?

## Solution

The time is unknown. Cover $t$ in the Magic Triangle.

$$
t=? \text { or appears. } \quad \text { Use } t=\frac{\mathrm{I}}{P r}
$$

$$
\begin{array}{ll}
\mathrm{I}=\$ 250 & t=\frac{250}{500(0.06)} \\
P=\$ 500 & =6 \%=0.06
\end{array} \quad t=\frac{250}{30}=8.33 \text { or } 8 \frac{1}{3} \text { years }
$$

It will take 8.33 years.

## Exercise 2

1. Find the principal needed to earn,
a. $\$ 100$ at $5 \%$ in 1 year
b. $\$ 10$ at $20 \%$ in 1 year
c. $\$ 60$ at $9 \frac{1}{2} \%$ in 90 days
d. $\$ 1000$ at $2.75 \%$ in 9 months
2. Find the interest rate when,
a. $\$ 1000$ earns $\$ 25$ in 1 year
b. $\$ 100$ earns $\$ 3$ in 0.5 years
c. $\$ 400$ earns $\$ 1.60$ in 1 month
d. $\$ 550$ earns $\$ 4.80$ in 73 days
3. Find the time needed to earn,
a. $\$ 5$ interest on $\$ 100$ at $10 \%$
b. $\$ 1$ interest on $\$ 10000$ at $12.5 \%$ (answer in days)
c. $\$ 4$ interest on $\$ 100$ at $7.5 \%$
d. $\$ 3$ interest on $\$ 100$ at $10 \%$
4. Fill in the missing values.

| I | $P$ | $r$ | $t$ |
| :---: | :---: | :---: | :---: |
|  | $\$ 100.00$ | $3 \%$ | 1 year |
| $\$ 50.00$ |  | $5 \%$ | 6 months |
| $\$ 3.42$ | $\$ 631.38$ |  | 1 month |
| $\$ 38.00$ | $\$ 800.00$ | $4.75 \%$ |  |

5. At the beginning of the year, Bill invested $\$ 500$ in a special account. At the end of the year the account was worth a total of $\$ 523.25$. What interest rate did he earn on the $\$ 500$ investment?
6. Velma invests $\$ 1200$ at $6.5 \%$. How long will it take to earn $\$ 10$ in interest on the investment? (Answer in days.)
7. A certain credit card company charged $\$ 3.45$ interest on a $\$ 230$ unpaid bill over a 30 day period. What interest rate was the credit card company charging?
8. Kim bought 200 shares of Ajax Fuelcells at $\$ 18$ per share. Over a 9 month period she received quarterly dividends of $\$ 0.26, \$ 0.24$, and $\$ 0.31$ per share. Also, over this time the shares have increased from $\$ 18$ to $\$ 22.50$.
a. How much money did Kim invest?
b. How much in dividends, per share, did Kim receive altogether?
c. What were her total earnings in dividends?
d. What percent did the dividends earn per share?
e. How much did Kim earn altogether when her stock went from $\$ 18$ to $\$ 22.50$ ? This is called capital gains. (Do not include the dividend earnings.)
f. What were her total earnings (dividends plus capital gains)?
g. What total percent gain has Kim realized on her investment?

Answers are on page 65.

## Unit 3: Compound interest

Imagine you have a $\$ 100$ investment that earns $10 \%$ interest per year. At the end of one year you will have earned $\$ 10$ in interest. If the investment pays simple interest you take the $\$ 10$ and let the original principal of $\$ 100$ earn interest at $10 \%$ in the second year. If the investment pays compound interest and you leave the $\$ 10$ in the investment you will earn interest on $\mathbf{\$ 1 1 0}$ in the second year. In this case you would be earning interest not only on the original principal, but also on the previously earned interest.

When interest is earned on interest, we say the interest is compounded and the amount earned is called compound interest.

The following table shows how the value of a $\$ 100$ investment, earning $10 \%$ compounded annually, changes over a 6-year period.

| Year | Principal Amount | Earned Interest | Year End Total |
| :--- | :--- | :--- | :--- |
| 1 | $\$ 100$ | $\$ 10$ | $\$ 110$ |
| 2 | $\$ 110$ | $\$ 11$ | $\$ 121$ |
| 3 | $\$ 121$ | $\$ 12.10$ | $\$ 133.10$ |
| 4 | $\$ 133.10$ | $\$ 13.31$ | $\$ 146.41$ |
| 5 | $\$ 146.41$ | $\$ 14.64$ | $\$ 161.05$ |
| 6 | $\$ 161.05$ | $\$ 16.11$ | $\$ 177.16$ |

Notice that the investment is worth $\$ 177.16$ at the end of 6 years. It has earned $\$ 77.16$ in interest. If the investment had earned simple interest as opposed to compound interest, it would have only earned $(\mathrm{I}=P r t=100 \times 0.10 \times 6) \$ 60$ in interest.

The above method of calculating the compound interest is very time consuming. Fortunately, there is a mathematical formula that we can use to calculate compound interest.

The compound interest formula is

$$
\begin{aligned}
A=P\left(1+\frac{r}{n}\right)^{n t} \quad \text { where, } \quad A & =\text { total compound amount (includes principal } \\
& \quad \text { and interest) } \\
P & =\text { principal } \\
r & =\text { annual interest rate } \\
n & =\text { number of times in one year that interest is } \\
& \quad \text { calculated } \\
t & =\text { time (in years) }
\end{aligned}
$$

Since A includes the principal and interest, to find the interest amount calculate:
$\mathrm{I}=A-P$

## Example 1

Find the compound amount and the interest earned on $\$ 100$ compounded annually at $10 \%$ for 6 years.

## Solution

$$
\begin{array}{lll}
\begin{array}{l}
P=\$ 100 \\
r=10 \%=0.1 \\
n=1(\text { since the interest is } \\
\text { calculated once a year) } \\
t=6 \text { years }
\end{array} & A=P\left(1+\frac{r}{n}\right)^{n t} & \\
& A=100\left(1+\frac{0.1}{1}\right)^{1 \times 6} & \begin{array}{l}
\text { Replace the variables with } \\
\text { their values }
\end{array} \\
& A=100(1.1)^{6} & \frac{0.1}{1}=0.1 \text { and } 1 \times 6=6 \\
& \mathrm{~A}=100(1.771561)=177.1561 & \text { Raise }(1.1)^{6}=1.771561
\end{array}
$$

The compound amount is $\mathbf{\$ 1 7 7 . 1 6}$
The interest earned is $\mathrm{A}-\mathrm{P}=\$ 177.16-\$ 100=\$ 77.16$
Notice that this answer agrees perfectly with the answer calculated by the table method on the previous page. To find (1.1) ${ }^{6}$ use the power function $y^{x}$ or $x^{y}$ on your calculator.

|  | To calculate $A=100\left(1+\frac{0.01}{1}\right)^{6}$ press, <br>  |
| :---: | :---: |
| Calculator Tip | Did you get $177.1561 ?$ |

NOTE If you did not get 177.1561 on your calculator, you may have to press a different sequence of buttons. Check with your instructor.

## Example 2

Find the compound amount and the interest earned on $\$ 500$ compounded monthly at $6 \%$ for 3 years.

## Solution

$$
\begin{aligned}
& P=\$ 500 \\
& r=6 \%=0.06 \\
& n=12
\end{aligned}
$$

$$
A=P\left(1+\frac{r}{n}\right)^{n t}
$$

(since the interest is calculated monthly, or 12 times per year) $t=3$

$$
\begin{aligned}
& A=500\left(1+\frac{0.06}{12}\right)^{12 \times 3} \\
& A=500\left(1+\frac{0.06}{12}\right)^{36} \\
& A=500(1.005)^{36} \\
& A=500(1.19668) \\
& A=598.34
\end{aligned}
$$

The compound amount is $\mathbf{\$ 5 9 8 . 3 4}$ and the interest earned is $\mathbf{\$ 5 9 8 . 3 4} \mathbf{- \$ 5 0 0}=\mathbf{\$ 9 8} .34$
NOTE If you did not get 598.34 on your calculator, you may have to press a different sequence of buttons. Check with your instructor.

Interest can be compounded in a variety of ways. The variable $n$ in the compound interest formula reflects the number of times in one year that interest is calculated.

If interest is compounded annually, then $n=1$.
If interest is compounded semi-annually, then $n=2$.
If interest is compounded quarterly, then $n=4$.
If interest is compounded monthly, then $n=12$.
If interest is compounded weekly, then $n=52$.
If interest is compounded daily, then $n=365$.

## Exercise 3

1. Determine the value of $n$ for each of the following.
a. yearly, then $n=$ $\qquad$ d. monthly, then $n=$ $\qquad$
b. semi-annually, then $n=$
e. weekly, then $n=$ $\qquad$
c. quarterly, then $n=$ $\qquad$ f. daily, then $n=$ $\qquad$
2. Ada invested $\$ 1000$ at $5 \%$ compounded annually.
a. Complete the table below to find the compound amount Ada will earn at the end of 5 years.

| Year | Principal Amount | Earned Interest | Year End Total |
| :--- | :--- | :--- | :--- |
| 1 | $\$ 1000$ | $\$ 50$ | $\$ 1050$ |
| 2 | $\$ 1050$ | $\$ 52.50$ |  |
| 3 |  |  |  |
| 4 |  |  |  |
| 5 |  |  |  |

b. Use the compound interest formula to determine the compound amount Ada will earn in 5 years.
3. Find the compound amount and the earned interest.
a. $\$ 100$ compounded annually at $9 \%$ for 5 years.
b. $\$ 100$ compounded semi-annually at $9 \%$ for 5 years.
c. $\$ 100$ compounded quarterly at $9 \%$ for 5 years.
d. $\$ 100$ compounded monthly at $9 \%$ for 5 years.
e. $\$ 100$ compounded daily at $9 \%$ for 5 years.
4. When Penny was born her parents put $\$ 500$ in a special fund paying $12 \%$ compounded quarterly.
a. How much will the fund be worth when Penny turns 10 years old?
b. When she turns 18 years old?
5. a. Agnes is 35 . If she invests $\$ 1000$ now, and she hopes to earn $10 \%$ compounded annually, how much will her investment be worth when she retires at the age of 65 ?
b. Suppose Agnes invested the $\$ 1000$ at $10 \%$ when she was 25 . How much would it be worth when she is 65 ?
6. Imagine you had $\$ 10000$ and a choice between buying a bond paying $8 \%$ simple interest or buying a savings certificate paying $7.75 \%$ compounded monthly.
a. How much will the bond earn (in interest) in one year?
b. How much interest will the savings certificate earn after one year?
c. Which is the better deal and by how much?
7. You have $\$ 2500$ to invest, compounded monthly, over a period of 10 years. Compare the compound amount when interest rates are as follows:
a. $6 \%$
b. $12 \%$
c. $18 \%$
d. Notice that the interest rate of $18 \%$ is triple that of the $6 \%$ rate. How many times higher is the compound amount earned by the $18 \%$ interest rate than the amount earned by the $6 \%$ rate?
8. L. Shark says that he will lend you the $\$ 5000$ you need but he wants $50 \%$ compounded daily on the loan. (And, you had better pay him within 90 days.)

How much will you owe him in:
a. 30 days

Hint: here $n=365$ and $t=\frac{30}{365}$
b. 60 days
c. 90 days
d. Does it make sense to pay off a loan quickly?

Answers are on pages 65 .

## Unit 4: Variations on compound interest - present value

Imagine you wanted to know how much principal you needed to invest right now in order to have $\$ 5000$ (the compound amount) six years from now at a certain compound interest rate.

The amount you need now to earn a desired amount in the future is called the present value.

The present value can be calculated by solving the compound interest formula for $P$.

$$
\begin{aligned}
& A=P\left(1+\frac{r}{n}\right)^{n t} \\
& \frac{A}{\left(1+\frac{r}{n}\right)^{n t}}=P \quad \text { divide both sides by }\left(1+\frac{r}{n}\right)^{n t}
\end{aligned}
$$

| The present value formula is: |  |
| :--- | :--- |
| $P=\frac{A}{\left(1+\frac{r}{n}\right)^{n t}}$ |  |
| where $\quad P$ | $=$ present value |
| $A$ | $=$ desired future amount |
| $r$ | $=$ interest rate |
| $n$ | $=$ number of times interest is calculated in one year |
| $t$ | $=$ time (in years) |

## Example 1

Pat and her friends are planning a reunion in five years. She estimates that the cost of the trip plus expenses will be approximately $\$ 2000$. How much should she invest right now in order to have $\$ 2000$ five years from now, if she thinks her money will earn $6 \%$ compounded quarterly?

## Solution

$$
\begin{aligned}
& P=? \\
& A=\$ 2000 \\
& r=6 \%=0.06 \\
& n=4 \\
& t=5 \text { years }
\end{aligned}
$$

$$
\begin{array}{ll}
P=\frac{A}{\left(1+\frac{r}{n}\right)^{n t}} & \begin{array}{ll}
P=\frac{2000}{\left(1+\frac{0.06}{4}\right)^{4(5)}} & \begin{array}{l}
\text { Replace the variables with } \\
\text { their values }
\end{array} \\
P=\frac{2000}{\left(1+\frac{0.06}{4}\right)^{20}} & \text { Multiply 4(5)=20 } \\
P=\frac{2000}{(1+1.015)^{20}} & \text { Divide } \frac{0.06}{4}=0.015 \\
P=\frac{2000}{(1.015)^{20}} & \text { Add } 1+0.015=1.015 \\
P=\frac{2000}{1.346855} & \text { Raise }(1.015)^{20}=1.346855 \\
P=1484.94 &
\end{array}
\end{array}
$$

The present value is $\mathbf{\$ 1 4 8 4 . 9 4}$
In other words, if Pat invested $\$ 1484.94$ now at $6 \%$ compounded quarterly, then in 5 years the compound amount would be $\$ 2000$.

## Exercise 4

1. Find the present value in each of the following.
a. $\$ 100$ due in 5 years at $6 \%$ compounded semi-annually.
b. $\$ 2500$ due in 2 years at $9 \%$ compounded monthly.
c. $\$ 4000$ due in 10 years at $10 \%$ compounded yearly.
d. $\$ 650$ due in $3 \frac{1}{2}$ years at $4 \%$ compounded quarterly.
e. $\$ 1000$ due in 6 months at $8 \frac{1}{2} \%$ compounded monthly.
2. In 6 years, Sylvia's son will be going to college. Sylvia estimates that her son will then need about $\$ 8000$ to get started in the first year of his education. How much should she invest now if she can earn 7\% compounded monthly?
3. The Smiths inherited $\$ 20000$. They would like to spend some now, but still have $\$ 20000$ fifteen years from now when they retire. They think they could average $10 \%$ compounded yearly over this time.
a. How much should they invest now?
b. How much of the $\$ 20000$ can they spend now?
4. A certain certificate will pay the owner $\$ 1000$ in the year 2020. If money is worth $8 \%$ compounded semi-annually, how much must you pay for the certificate in
a. 2015
b. 2010
c. 2005
d. this year

Answers are on page 65.

## Unit 5: Nominal and effective rates of interest

Bank A has a savings plan that offers $6.25 \%$ compounded monthly and Bank B offers $6.5 \%$ compounded semi-annually. Which offers the better rate of return? There is a formula for dealing with this problem. The formula converts a nominal interest rate into an effective interest rate. Here, both the $6.25 \%$ compounded monthly and the $6.5 \%$ compounded semiannually are the nominal rates. The effective rate reflects the rate of interest actually earned in one year.

Again, the formula for effective rate is a variation on the compound interest formula, $A=P\left(1+\frac{r}{n}\right)^{n t}$. See Appendix B for the derivation.

The effective interest rate formula is,

$$
\begin{aligned}
f=\left(1+\frac{r}{n}\right)^{n}-1 \quad \text { where } \quad f & =\text { effective interest rate } \\
r & =\text { nominal interest rate (annual interest rate) } \\
n & =\begin{array}{c}
\text { number of times in one year that interest is } \\
\\
\quad \text { calculated }
\end{array}
\end{aligned}
$$

## Example 1

What is the effective rate of $4 \%$ compounded monthly?

## Solution

$$
\begin{aligned}
f & =? \\
r & =4 \%=0.04 \\
n & =12
\end{aligned}
$$

$$
f=\left(1+\frac{r}{n}\right)^{n}-1
$$

$$
f=\left(1+\frac{0.04}{12}\right)^{12}-1 \quad \begin{aligned}
& \text { Replace the variables with } \\
& \text { their values }
\end{aligned}
$$

$$
f=(1+0.0033333)^{12}-1 \quad \text { Divide } 0.04 \text { by } 12
$$

$$
f=(1.0033333)^{12}-1 \quad \text { Add } 1+0.0033333
$$

$$
f=1.040742-1 \quad \text { Raise }(1.0033333)^{12}
$$

$$
f=0.040742=4.07 \%
$$

The rate of $4 \%$ compounded monthly is the same as, or effectively, $\mathbf{4 . 0 7 \%}$.

## Example 2

What is the effective rate of $4 \%$ compounded yearly?

## Solution

$$
\begin{array}{ll}
\begin{array}{l}
f=? \\
r=4 \%=0.04 \\
n=1
\end{array} & f=\left(1+\frac{r}{n}\right)^{n}-1 \\
& f=\left(1+\frac{0.04}{1}\right)^{1}-1 \\
& f=(1+0.04)-1 \\
& f=1.04-1=0.04
\end{array}
$$

The effective rate of $4 \%$ compounded annually is still $4 \%$. Notice that the effective rate will equal the yearly compound rate, but will always be more than the semi-annual, quarterly, monthly, weekly or daily nominal rate.

## Example 3

Bank Alberta offers $6.25 \%$ compounded monthly while Bank BC offers $6.5 \%$ compounded semi-annually. Which bank offers the better effective rate of return?

## Solution

For Bank Alberta,

$$
\begin{aligned}
& f=? \\
& r=6.25 \%=0.0625 \\
& n=12
\end{aligned}
$$

$$
\begin{aligned}
& f=\left(1+\frac{0.0625}{12}\right)^{12}-1 \\
& f=(1+0.0052083)^{12}-1 \\
& f=(1.0052083)^{12}-1 \\
& f=1.064322-1 \\
& f=0.064322=6.43 \%
\end{aligned}
$$

We can stop here. Notice that Bank Alberta's effective rate, $6.43 \%$, is still less than Bank BC's nominal rate of $6.5 \%$. Bank BC's effective rate will be even greater than $6.5 \%$, so Bank BC offers the better effective rate of return. (Bank BC's effective rate is $6.61 \%$.)

## Exercise 5

1. Determine the effective rates for the following when they are compounded monthly.
a. $8 \%$
b. $10 \%$
c. $12 \%$
d. $5 \%$
2. Determine the effective rate when $10 \%$ is compounded
a. yearly
b. semi-annually
c. quarterly
d. monthly
e. weekly
f. daily
3. You have a choice between purchasing a savings bond paying $9 \%$ simple interest or putting your money in a savings account at $8 \frac{3}{4} \%$ compounded monthly. What is the better rate of return and what is the difference between the effective percentage rates?
4. What simple interest rate would give you the same return as $6 \%$ compounded monthly?

Answers are on page 65.

## Unit 6: Ordinary annuities

Imagine you plan to open a savings account and deposit $\$ 100$ at the end of each month. A sequence of equal payments at equal intervals like this is called an ordinary annuity.* When compound interest is calculated on each payment, the value of the annuity can grow substantially.

An obvious question you might ask about an annuity is how much will the annuity be worth in 6 months, or 1 year, or 5 years or even 20 years?

To see how the annuity process works, study the table below. In this case, $\$ 100$ is deposited at the end of each month into an account that pays $6 \%$ interest compounded monthly. The process is continued for 6 months.

| Date | Total amount from <br> previous month | Interest earned on <br> total amount | Monthly deposit |  |
| :---: | :---: | :---: | :---: | :---: |
| Jan. 31 | - | - | $\$ 100$ |  |
| Feb. 28 | $\$ 100$ | $\$ 0.50$ | $\$ 100$ |  |
| March 31 | $\$ 200.50$ | $\$ 1.0025$ | $\$ 100$ |  |
| April 30 | $\$ 301.5025$ | $\$ 1.5075$ | $\$ 100$ |  |
| May 31 | $\$ 403.01$ | $\$ 2.0151$ | $\$ 100$ |  |
| June 30 | $\$ 505.0251$ | $\$ 2.5251$ | $\$ 100$ |  |
| July 1 | $\$ 607.55$ |  |  |  |

Notice above that the interest is calculated on the previous month's total amount before the current month's deposit is made using the formula $\mathrm{I}=$ Prt. For example, the interest earned on May 31, is

[^0]$$
\mathrm{I}=\operatorname{Pr} t=403.01(0.06)\left(\frac{1}{12}\right)=\$ 2.0151
$$

There is a formula for calculating the annuity amount.

## Example 1

Use the annuity formula to find the annuity amount in 6 months if $\$ 100$ is deposited monthly at $6 \%$ compounded monthly. Compare this answer to the answer obtained in the table.

## Solution

$A=$ ?
$P=\$ 100$
$r=6 \%=0.06$
$n=12$
$t=6$ months $=0.5$ years

$$
A=\frac{n P\left[\left(1+\frac{r}{n}\right)^{n t}-1\right]}{r}
$$

$$
\begin{array}{ll}
A=\frac{12(100)\left[\left(1+\frac{0.06}{12}\right)^{12(0.5)}-1\right]}{0.06} & \text { Replace variables } \\
A=\frac{1200\left[(1+0.005)^{6}-1\right]}{0.06} & \text { Divide and multiply }
\end{array}
$$

$$
A=\frac{1200\left[(1.005)^{6}-1\right]}{0.06} \quad \text { Add }
$$

$$
A=\frac{1200(1.0303775-1)}{0.06} \quad \text { Calculate the power }
$$

$$
A=\frac{1200(0.0303775)}{0.06} \quad \text { Subtract }
$$

$$
A=\frac{36.45301}{0.06}=607.55 \quad \text { Multiply and divide }
$$

The annuity is worth $\mathbf{\$ 6 0 7 . 5 5}$. This answer agrees perfectly with the table answer.

## Example 2

How much would an annuity be worth in 2 years at $6 \%$ compounded monthly if the periodic payments are $\$ 50$ per month?

## Solution

$$
\begin{aligned}
& A=? \\
& P=\$ 50 \\
& r=6 \%=0.06 \\
& n=12 \\
& t=2
\end{aligned}
$$

$$
\begin{aligned}
& A=\frac{n P\left[\left(1+\frac{r}{n}\right)^{n t}-1\right]}{r} \\
& A=\frac{12(50)\left[\left(1+\frac{0.06}{12}\right)^{12 \times 2}-1\right]}{0.06} \\
& A=\frac{600\left[(1+0.005)^{24}-1\right]}{0.06} \\
& A=\frac{600\left[(1.005)^{24}-1\right]}{0.06} \\
& A=\frac{600(1.12716-1)}{0.06} \\
& A=\frac{600(0.12716)}{0.06} \\
& A=\frac{76.296}{0.06}=1271.60
\end{aligned}
$$

The annuity is worth $\mathbf{\$ 1 2 7 1 . 6 0}$ after 2 years.
The total interest earned was $\$ 1271.60-1200=\$ 71.60$

## Exercise 6

1. a. Complete the table below, where $\$ 2000$ is deposited annually for 5 years at $5 \%$ compounded annually.

| Date | Total amount from <br> previous year | Interest earned on <br> total amount | Annual deposit |
| :---: | :---: | :---: | :---: |
| Dec. 31/01 | - | - | $\$ 2000$ |
| Dec. 31/02 | $\$ 2000$ | $\$ 100$ | $\$ 2000$ |
| Dec. 31/03 | $\$ 4100$ |  |  |
| Dec. 31/04 |  |  |  |
| Dec. 31/05 |  |  |  |
| Jan. 1/06 |  |  |  |

b. Use the annuity formula to calculate the above amount. Do your formula and table amounts agree?
2. Find the annuity amount when
a. a period payment of $\$ 1000$ per year earns $8 \%$ compounded annually for 10 years
b. a payment of $\$ 100$ per month earns $4 \%$ compounded monthly for 5 years
c. a payment of $\$ 200$ quarterly earns $10 \%$ compounded quarterly for 7 years
3. Daniel wishes to save $\$ 100$ a month. He hopes to earn $6 \%$ compounded monthly. What would his annuity be worth in
a. 1 year?
b. 2 years?
c. 5 years?
d. 10 years?
4. The Andersons plan to retire in 25 years and want to start saving for it now. They hope to be able to earn about $10 \%$ compounded annually. Determine the amount of their annuity if they make the following periodic payments.
a. $\$ 500$ per year
b. $\$ 1000$ per year
c. $\$ 2000$ per year
d. $\$ 3500$ per year
5. Imagine the Andersons had the choice of either investing \$1200 a year at $10 \%$ compounded annually for 25 years or investing $\$ 100$ per month at $10 \%$ compounded monthly for 25 years.
a. How much would the annual annuity be worth in 25 years?
b. How much would the monthly annuity be worth in 25 years?
c. Which investment (yearly or monthly annuity) earns the greater amount and by how much?
6. The Grinders plan to save for their child's education by depositing $\$ 40$ a month into a special savings plan which pays about $8 \%$ compounded monthly.
a. How much would the annuity be worth after 1 year?
b. How much after 18 years?
7. Imagine you start saving for your retirement and contribute $\$ 1000$ yearly and average $10 \%$ compounded annually. Of course, the amount of the annuity depends on the length of the annuity. Complete the table below.

| Years | Annuity Amount |
| :---: | :---: |
| 20 |  |
| 25 |  |
| 30 |  |
| 35 |  |
| 40 |  |

Note: Not only are retirement savings plans excellent ways to save for the future, the yearly payments you make along the way are tax-deductible. (i.e. If you were in the $19 \%$ tax bracket, a $\$ 1000$ R.S.P. would save you at least $\$ 190$ a year in taxes.)
8. In question 7 above, what is the effect of saving for your retirement over a 40 year period as opposed to a 20 year period?

Answers are on page 65.

## Unit 7: Annuity payments

Often when you are saving, you have some goal in mind. For example, suppose you need about $\$ 5000$ for a down payment on a mobile home that you would like to buy 3 years from now. If money can earn $7 \%$ compounded monthly, what monthly payment is needed to accumulate $\$ 5000$ in 3 years?

The above problem involves solving the annuity formula for $P$.

| The periodic payment formula is: |
| :--- | :--- |
| $P=\frac{A\left(\frac{r}{n}\right)}{\left(1+\frac{r}{n}\right)^{n t}-1} \quad$ where $\quad$$A=$ annuity amount <br> $r=$ annual interest rate <br> $n=$ number of times interest is <br> calculated in one year <br> $t=$ time (in years) |

## Example 1

What monthly payment is necessary for an annuity to be worth $\$ 5000$ in 3 years at $7 \%$ compounded monthly?

## Solution

$$
\begin{aligned}
& P=? \\
& A=\$ 5000 \\
& r=7 \%=0.07 \\
& t=3
\end{aligned}
$$

$$
P=\frac{A\left(\frac{r}{n}\right)}{\left(1+\frac{r}{n}\right)^{n t}-1}
$$

$$
P=\frac{5000\left(\frac{0.07}{12}\right)}{\left(1+\frac{0.07}{12}\right)^{12 \times 3}-1}
$$

$$
P=\frac{5000(0.0058333)}{(1.0058333)^{36}-1}
$$

Replace variables with their values

Divide 0.07 by 12

$$
\begin{array}{ll}
P=\frac{29.16667}{1.23292-1} & \begin{array}{l}
\text { Multiply and calculate the } \\
\text { power }
\end{array} \\
P=\frac{29.16667}{0.23292}=125.22 &
\end{array}
$$

The periodic payment is $\mathbf{\$ 1 2 5 . 2 2}$

## Exercise 7

1. Find the periodic payment needed for an annuity of
a. $\$ 1000$ at $5 \%$ compounded monthly for 1 year
b. $\$ 20000$ at $10 \%$ compounded yearly for 15 years
c. $\$ 5000$ at $8 \%$ compounded quarterly for 3 years
2. Mike wants to buy a $\$ 1500$ stereo 9 months from now. How much will he have to deposit every month into a savings plan paying $6.5 \%$ compounded monthly?
3. Suppose you would like to save $\$ 1000$ every year. What monthly payment would you have to make if money can earn $7 \%$ compounded monthly?
4. Imagine you would like to retire with a $\$ 100000$ annuity. And, suppose that over the years you hope that money will be worth an average of $10 \%$ compounded annually. Your yearly payments, of course, will depend upon the length of the annuity. Complete the table below.

| Years | Yearly Payment |
| :---: | :---: |
| 15 |  |
| 20 |  |
| 25 |  |
| 30 |  |
| 35 |  |
| 40 |  |

Do you see the difference between planning for retirement early as opposed to later in life?
5. The Wests need $\$ 9000$ for their child's education 6 years from now. How much should they put aside every month if they hope to earn $8.5 \%$ compounded monthly?
6. Imagine you wanted to be a millionaire 30 years from now. How much would you have to put into an annuity every year if you think you could earn $12 \%$ compounded yearly?

Answers are on page 65.

## Unit 8: Loans

Until now, we have looked at the various ways our investments earned money (simple interest, compound interest and annuities). Now it's time to consider how the financial institutions charge us for the use of their money.

When you take out a loan with a company or institution, you receive the principal amount and you agree to pay back in a fixed amount of time through equal payment amounts at a certain interest rate. For example, suppose you borrow $\$ 1000$ from a bank at $12 \%$ and agree to pay off the loan in 6 months with regular monthly payments. The bank would then calculate your monthly payments to be $\$ 172.55$. The way in which your debt would be disposed of is shown below.

|  Amount Owing <br> at beginning of <br> Month Interest Owing at end of <br> Month <br> $\left(\frac{r}{n}=\frac{0.12}{12}=0.01\right.$ or 1\% $)$ Monthly <br> Payment Amount of Loan <br> Repaid at End of <br> Month <br> 1 1000.00 10.00 172.55 162.55 <br> 2 837.45 8.37 172.55 164.18 <br> 3 673.27 6.73 172.55 165.82 <br> 4 507.45 5.07 172.55 167.48 <br> 5 339.97 3.40 172.55 169.15 <br> 6 170.82 1.71 172.55 170.84 |
| :--- |
| Totals |

What is happening above is that at the end of the first month the bank charges you $12 \% \div 12=1 \%$ on the amount owing or $\$ 10$ interest for the use of the $\$ 1000$. The bank takes $\$ 10$ from the $\$ 172.55$ payment you gave them. The remaining $\$ 162.55$ is then subtracted from the original $\$ 1000$ loan. At the beginning of the second month, you now owe $\$ 1000-\$ 162.55=\$ 837.45$. At the end of the second month the bank will again take the interest ( $\$ 8.37$ ) owing them and reduce your loan accordingly. This continues until the loan is reduced to $\$ 0.00$.

Naturally, mathematicians have devised a formula for determining the periodic payments necessary to pay down a loan.

| The periodic payment on a loan formula is: |
| :--- | :--- |
| $P=\frac{A\left(\frac{r}{n}\right)}{1-\left(1+\frac{r}{n}\right)^{-n t}} \quad$$P=$ periodic payment amount <br> $A=$ amount of loan <br> $r=$ annual interest rate <br> $n=$ number of payments made in one year <br> $t=$ time (in years) |

## Example 1

Audrey decides to borrow $\$ 3000$ to buy a computer for her home based bookkeeping business.

Determine the monthly payments needed to pay down a loan of $\$ 3000$ at $9 \%$ over 2 years.

## Solution

$$
\begin{aligned}
& P=? \\
& A=\$ 3000 \\
& r=9 \%=0.09 \\
& n=12 \\
& t=2
\end{aligned}
$$

$$
P=\frac{A\left(\frac{r}{n}\right)}{1-\left(1+\frac{r}{n}\right)^{-n t}}
$$

$$
P=\frac{3000\left(\frac{0.09}{12}\right)}{1-\left(1+\frac{0.09}{12}\right)^{-12(2)}}
$$

Replace variables with their values

$$
P=\frac{3000(0.0075)}{1-(1.0075)^{-24}}
$$

Divide 0.09 by 12

$$
P=\frac{22.5}{1-0.83583}
$$

Multiply and calculate the power

$$
P=\frac{22.5}{0.16417}=137.05
$$

Subtract and divide

The monthly payments would be $\mathbf{\$ 1 3 7 . 0 5}$
In the above example, the borrower paid a total of $(\$ 137.05 \times 12 \times 2)=\$ 3289.20$ to the lender.

The borrower paid back the original $\$ 3000$ plus an extra $\$ 289.20$. This $\$ 289.20$ is called the finance charge on the loan.

| The finance charge formula is: |  |
| :--- | :--- |
|  | F.C. $=$ finance charge <br> $P=$ periodic payment amount |
| $F . C .=n t P-A \quad$ where $\quad$$A=$ loan amount <br> $n=$ number of payments made in a year <br> $t=$ time (in years) |  |

## Example 2

Lee could buy a used truck for $\$ 8900$ with a $\$ 1000$ down payment and finance the rest at $6 \%$ over three years. What would the monthly payments on the truck be, and what is the finance charge?

## Solution

$$
\begin{aligned}
A & =\$ 8900-\$ 1000 \\
& =\$ 7900 \\
r & =6 \%=0.06 \\
n & =12 \\
t & =3
\end{aligned}
$$

$$
\begin{aligned}
& P=\frac{A\left(\frac{r}{n}\right)}{1-\left(1+\frac{r}{n}\right)^{-n t}} \\
& P=\frac{7900\left(\frac{0.06}{12}\right)}{1-\left(1+\frac{0.06}{12}\right)^{-12(3)}} \\
& P=\frac{7900(0.005)}{1-(1.005)^{-36}} \\
& P=\frac{39.5}{1-0.83564} \\
& P=\frac{39.5}{0.16436}=240.33
\end{aligned}
$$

The monthly payment would be $\mathbf{\$ 2 4 0 . 3 3}$

To find the finance charge,

```
F.C. = ntP-A
F.C. = 12(3)(240.33)-7900
F.C. = 8651.88-7900
F.C. = 751.88
```

The finance charge is $\mathbf{\$ 7 5 1 . 8 8}$

## Exercise 8

1. Determine the monthly payments needed to pay down a loan of $\$ 1000$ at $14 \%$ in 1 year. Also determine the finance charge.
2. Complete the table below where a $\$ 5000$ loan is to be paid off in 3 years in monthly payments.

| Interest Rate | Monthly Payment | Finance Charge |
| :---: | :---: | :---: |
| $6 \%$ |  |  |
| $9 \%$ |  |  |
| $13 \%$ |  |  |
| $19 \%$ |  |  |

Notice the effects of high interest rates.
3. Complete the table below. This time, suppose the loan is $\$ 2000$ at $12 \%$ and the payments are monthly.

| Term of Loan | Monthly Payment | Finance Charge |
| :---: | :---: | :---: |
| 6 Months |  |  |
| 1 Year |  |  |
| 2 Years |  |  |
| 5 Years |  |  |

Notice here that the longer the term, the lower the payments but the higher the finance charge.
4. A living room set is on sale for $\$ 1495$. You make a down payment of $\$ 600$ but will have to finance the rest at $5 \%$ over 1 year. What would your monthly payments be? What would the finance charge be?
5. An electronics discount store has a stereo system on sale for $\$ 1199$ for only $\$ 99$ down, $\$ 99$ per month for one year or you could get a loan from the bank for $12 \%$.
a. What would the monthly payments amount to if you financed through the bank for one year? Assume that you do make the $\$ 99$ down payment.
b. What is the electronics discount store's finance charge?
c. What is the bank's finance charge?
d. From whom would you receive the best deal?

Answers are on pages 65.

## Unit 9: Mortgages

When you borrow money to buy a house or property, the loan is called a mortgage. The terms of a mortgage can be rather complicated and varied. Some facts about mortgages:

1. The term (length) of a mortgage can vary from a few years to 30 years.
2. During the term of the mortgage, the interest rate can change dramatically. For example, you can begin with a fixed rate of interest for the first 6 months, 1, 2, 3 or 5 years of the mortgage. At the end of this fixed time, a new interest rate is established.
3. Depending on the lending institution, you can periodically make lump sum payments to reduce the amount of the mortgage.
4. You can significantly reduce the term of the mortgage by changing monthly payments to weekly payments.
5. If you fail to make payments on the mortgage, the mortgage holder has the right to take possession of "your" property.
6. As a general rule, if you purchase a home:
a. it should not cost more than $2 \frac{1}{2}$ times your annual gross income,
b. you should be able to make at least a $10 \%$ down payment on the cost of the house, and
c. your monthly payments should not exceed $\frac{1}{3}$ of your net monthly income.

## Example 1

Determine the monthly payments needed to pay down a mortgage of $\$ 100000$ at $7.5 \%$ over 20 years. Also, determine the finance charge on the mortgage.

Note that the mortgage rate will change over the course of 20 years. Nevertheless, we can still get a sense of what the final finance charge might approximate.

## Solution

$P=$ ?
$A=\$ 100000$
$r=7.5 \%$ or 0.075
$n=12$
$t=20$

$$
P=\frac{A\left(\frac{r}{n}\right)}{1-\left(1+\frac{r}{n}\right)^{-n t}}
$$

$$
P=\frac{100000\left(\frac{0.075}{12}\right)}{1-\left(1+\frac{0.075}{12}\right)^{-12 \times 20}}
$$

$$
P=\frac{100000(0.00625)}{1-(1+0.00625)^{-240}}
$$

$$
P=\frac{625}{1-(1.00625)^{-240}}
$$

$$
\begin{aligned}
& P=\frac{625}{1-0.22417} \\
& P=\frac{625}{0.77583}=805.59
\end{aligned}
$$

The monthly payment on the mortgage is $\mathbf{\$ 8 0 5 . 5 9}$
The finance charge is,
$F . C .=n t P-A=12(20)(805.59)-100000=93341.60$
The finance charge is an amazing \$93 341.60

## Exercise 9

1. As stated on page 46, as a general rule, if you purchase a home:
a. it should not cost more than $2 \frac{1}{2}$ times your annual gross income,
b. you should be able to make at least a $10 \%$ down payment on the cost of house, and
c. your monthly payments should not exceed $\frac{1}{3}$ of your net monthly income.

Imagine you wanted to buy a condominium for $\$ 120000$. According to the "rules" suggested in $\mathrm{a}, \mathrm{b}$, and c above, determine the necessary:
a. annual gross income
b. $10 \%$ down payment
c. monthly payments if you net income was $\$ 2000$ per month
2. Determine the monthly payment needed to pay down a $\$ 80000$ mortgage over 20 years at 7\%. Calculate the finance charge on this mortgage.
3. Complete the following table where the mortgage is $\$ 90000$ for 20 years.

| Interest Rate | Monthly Payment | Finance Charge |
| :---: | :---: | :---: |
| $8 \%$ |  |  |
| $10 \%$ |  |  |
| $12 \%$ |  |  |
| $14 \%$ |  |  |

Note how the finance charge increases as the interest rate increases.
4. Complete the table below where the mortgage is $\$ 100000$ and the interest rate is 7.5\%.

| Length of Mortgage | Monthly Payment | Finance Charge |
| :---: | :---: | :---: |
| 15 years |  |  |
| 20 years |  |  |
| 25 years |  |  |
| 30 years |  |  |

Note how the finance charge increases as the length of the mortgage increases.
5. The Jones have $\$ 8500$ for a down payment on a $\$ 63900$ cottage. What would their weekly payments be if the mortgage was $10.5 \%$ for 15 years?
6. The Waters are willing to sell their cottage for $\$ 29500$. The Pipes will buy the property for $\$ 6000$ down if the Waters agree to hold the mortgage at $9 \%$ for 10 years.
a. If the Waters agree, what monthly payment should they charge the Pipes?
b. At the end of 10 years, what is the finance charge earned by the Waters?
c. The Waters decide to put the monthly payments from the mortgage into an annuity paying $9 \%$ compounded monthly. How much will the annuity be worth in 10 years?

Answers are on page 65

## Unit 10: Interest rates on loans

Suppose a computer system is selling for $\$ 3333$ (taxes included). The store offers a payment plan of $\$ 99$ down and $\$ 99$ monthly payments for three years. You may wish to determine what interest rate the store is charging for this loan. The problem involves determining the $r$ value in the loan formula. The interest rate can be found using the Annual Percentage Rate Table on Appendix C.

## Example 1

What interest rate is charged on a loan of $\$ 3333$ if a down payment of $\$ 99$ is made on the loan and monthly payments of $\$ 99$ are made on the loan for three years?

## Solution

Step One Determine the amount of the loan $A=3333-99=3234$ (or the amount being financed). $\quad A=\$ 3234.00$

Step Two Determine the finance charge, $\quad$ F.C. $=n t P-A$ F.C. where $n=12, t=3$, and $\quad$ F.C. $=12(99)-3234=330$ $P=\$ 99 \quad$ F.C. $=\$ 330.00$
$\begin{array}{ll}\text { Step Three } & \begin{array}{l}\text { Determine the finance charge per } \\ \$ 100 .\end{array} \quad \frac{F . C .}{A} \times \$ 100=\frac{330}{3234} \times 100=10.20\end{array}$
Step Four Go to Appendix C and read down the "Number of Payments" column until you come to 36 (since there is a total of 36 payments made on this loan). Read across the row until you come to 10.20 (or as close to 10.20 as you can). The closest value is 10.34 . Reading up the column, you see that the Annual Percentage Rate is $6.5 \%$.

The store charges an interest rate of $6.5 \%$.

## Exercise 10

1. A used car is selling for $\$ 2500$ or $\$ 500$ down and $\$ 175$ per month for 12 months.
a. Find the amount financed.
b. Find the finance charge.
c. Determine the annual percentage rate charged for this loan.
2. Anthony borrowed $\$ 1400$ and will be paying $\$ 65.58$ a month for the next two years. What interest rate is he being charged?
3. A dining room set is selling for $\$ 1500$. You could pay $\$ 500$ down and $\$ 88$ for 12 months or $\$ 100$ down and $\$ 95$ for 16 months. What percentage rate is being charged in each situation?
4. Tracey has accumulated $\$ 4800$ in student loans. She decides to pay it off over the next five years. She is told that her monthly payments will be $\$ 96$ per month. What interest rate is Tracey being charged?
5. After the down payment, John will owe $\$ 5600$ on his truck at $\$ 197$ monthly for 3 years, if the deal is through Fred's Friendly Motors. He could also get a personal loan at his bank for $12.5 \%$.

What interest rate is Fred's charging and what would the best deal be?

Answers are on page 65.

## Review Questions

1. George had a $\$ 100$ bond earning $7 \frac{3}{4} \%$ interest per annum. At the end of the year, he received a cheque for $\$ 7.75$. What kind of interest did he earn (simple or compound)?
2. Sal put $\$ 100$ into a savings account. At the end of each month, the interest was calculated and deposited into Sal's account. Sal did not make any withdrawals from his account until the sixth month. What kind of interest was his account earning (simple or compound)?
3. Calculate the interest earned on a $\$ 350$ investment at $9 \%$ (simple interest) for 3 months.
4. A $\$ 1500$ investment earned $\$ 420$ interest after 3 years. What simple interest rate produced these earnings?
5. How much would a $\$ 2500$ certificate be worth in 5 years if it earns $10 \%$ compounded quarterly?
6. Wendy's grandparents would like to give her $\$ 1000$ when she turns 16 , six years from now. How much should they invest now if they can earn $8.5 \%$ compounded monthly?
7. What is the effective rate of $9.5 \%$ compounded weekly?
8. Terry decides to start saving $\$ 50$ a month. He can deposit it in an account yielding $4 \%$ compounded monthly. How much will his annuity be worth in 5 years?
9. Mary figures she will need about $\$ 7000$ in 10 years to help pay for her children's education. A savings fund pays $9.5 \%$ compounded quarterly. How much should she deposit every 3 months into the fund to reach her goal?
10. Peter can buy a $\$ 9950$ truck for $\$ 2000$ down and monthly payments at $9.1 \%$ for 3 years.
a. What would his monthly payments be?
b. What is his finance charge?
11. Joan is paying $\$ 65.50$ per month for 3 years on a $\$ 2000$ loan. What interest rate is she being charged?
12. The Browns have a $\$ 38000$ second mortgage over 20 years at $10 \%$.
a. Calculate their monthly payments.
b. Calculate the finance charge on this mortgage.

Answers are on page 65.

## Appendix A

## Simple Interest

$$
\begin{array}{ll}
\mathrm{I}=P r t & \mathrm{I}=\text { interest amount } \\
P=\frac{I}{r t} & P=\text { principal amount } \\
r=\frac{I}{P t} & r=\text { annual interest rate } \\
t=\frac{I}{P r} & t=\text { years }
\end{array}
$$

## Compound Interest

$$
A=P\left(1+\frac{r}{n}\right)^{n t} \quad A=\text { compound amount }
$$

$n=$ number of times interest is calculated in one year
$\mathrm{I}=A-P \quad P=$ principal (or present value) $\quad t=$ time (in years)

$$
P=\frac{A}{\left(1+\frac{r}{n}\right)^{n t}}
$$

$r=$ annual interest rate
I = interest amount

## Effective Interest Rate

$f=\left(1+\frac{r}{n}\right)^{n}-1$
$f=$ effective rate
$r=$ nominal rate (annual interest rate)
$n=$ number of times interest is calculated in one year

## Formulas

## Ordinary Annuities

$$
\begin{array}{rlrl}
A=\frac{n P\left[\left(1+\frac{r}{n}\right)^{n t}-1\right]}{r} & A & =\text { amount of annuity } \\
P & =\text { periodic payment } \\
P=\frac{A}{}=\frac{A\left(\frac{r}{n}\right)}{\left(1+\frac{r}{n}\right)^{n t}-1} & n & =\text { annual interest rate } \\
& t & =\text { time (in years) }
\end{array}
$$

## Loans and Mortgages

$$
\begin{array}{rl}
P=\frac{A\left(\frac{r}{n}\right)}{1-\left(1+\frac{r}{n}\right)^{-n t}} & \begin{array}{l}
P=\text { periodic payment } \\
A
\end{array} \\
F . C=\text { amount of loan or mortgage } \\
r=n t P-A & n=\text { annual interest rate } \\
t=\text { time (in years) } \\
\text { F.C. }=\text { finance charge }
\end{array}
$$

## Appendix B

When an investment earns compound interest, the actual interest earned is given by the formula,

$$
\mathrm{I}=A-P \text { or } \mathrm{I}=P\left(1+\frac{r}{n}\right)^{n t}-P
$$

If we let $t=1$ year and $P=\$ 1.00$, the amount of interest earned in one year is,

$$
\mathrm{I}=1\left(1+\frac{r}{n}\right)^{n(1)}-1=\left(1+\frac{r}{n}\right)^{n}-1
$$

Since the effective interest rate, $f$, is the same as the simple interest rate, $r$, earned on $\$ 1.00$ after 1 year, using $r=\frac{\mathrm{I}}{P t}$,

$$
f=r=\frac{\mathrm{I}}{P t}=\frac{\mathrm{I}}{1(1)}=\mathrm{I}=\left(1+\frac{\mathrm{r}}{\mathrm{n}}\right)^{n}-1
$$

The effective rate is,

$$
f=\left(1+\frac{r}{n}\right)^{n}-1
$$

## Appendix C

| Number | ANNUAL PERCENTAGE RATE |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

## Answers

## Exercise 1

1. a. 365
b. 52
c. 12
2. a. $\$ 100$
b. $\$ 7.50$
c. $\$ 11.25$
d. $\$ 5.50$
e. $\$ 3.50$
f. $\$ 2.00$
g. $\$ 44.52$
h. $\$ 30.29$
3. interest $\$ 56.25$, altogether $\$ 1500.00+56.25=\$ 1556.25$
4. $I=4.00(0.18)(1)=\$ 0.72$. 1 share (now) $=\$ 3.28$
5. a. $\$ 16$
b. $\$ 116$
c. $I=116(0.12)(1)=\$ 13.92$
d. $\$ 16.00+\$ 13.92=\$ 29.92$
6. Mary owes Larry $\$ 250+\$ 4.32=\$ 254.32$
7. a. $I=5000(0.0055)\left(\frac{6}{12}\right)=\$ 137.50 \quad$ b, $I=5000(0.0055) 5=\$ 1375.00$

## Exercise 2

1. a. $\$ 2000.00$
b. $\$ 50.00$
c. $\$ 2561.40$
d. $\$ 48484.85$
2. a. $2.5 \%$
b. $6 \%$
c. $4.8 \%$
d. $4.4 \%$
3. a. 0.5 years
b. 0.292 days
c. 0.53 years
d. 0.3 years
4. 

| I | $P$ | $r$ | $t$ |
| :---: | :---: | :---: | :---: |
| $\$ 3.00$ | $\$ 100.00$ | $3 \%$ | 1 year |
| $\$ 50.00$ | $\$ 2000.00$ | $5 \%$ | 6 months |
| $\$ 3.42$ | $\$ 631.38$ | $6.5 \%$ | 1 month |
| $\$ 38.00$ | $\$ 800.00$ | $4.75 \%$ | 1 year |

5. $4.65 \%$
6. 0.13 years or 47 days
7. $18.25 \%$
8. a. $200 \times \$ 18=\$ 3600.00$
b. $\$ 0.81$ per share
c. $200 \times \$ 0.81=\$ 162.00$
d. $r=\frac{162}{3600\left(\frac{9}{12}\right)}=6 \%$
e. $200 \times(22.50-18.00)=\$ 900.00$
f. Total earnings $=\$ 162+\$ 900=\$ 1062$
g. $r=\frac{1062}{3600\left(\frac{9}{12}\right)}=39.33 \%$

## Exercise 3

1. a. 1
b. 2
c. 4
d. 12
e. 52
f. 365
2. a.

| Year | Principal Amount | Earned Interest | Year End Total |
| :---: | :--- | :--- | :--- |
| 1 | $\$ 1000$ | $\$ 50$ | $\$ 1050$ |
| 2 | $\$ 1050$ | $\$ 52.50$ | $\$ 1102.50$ |
| 3 | $\$ 1102.50$ | $\$ 55.13$ | $\$ 1157.63$ |
| 4 | $\$ 1157.63$ | $\$ 57.88$ | $\$ 1215.51$ |
| 5 | $\$ 1215.51$ | $\$ 60.78$ | $\$ 1276.29$ |

b. $A=1000\left(1+\frac{0.05}{1}\right)^{1 \times 5}=\$ 1276.28$
3. a. $A=\$ 153.86, I=\$ 53.86$
b. $A=\$ 155.30, I=\$ 55.30$
c. $A=\$ 156.05, I=\$ 56.05$
d. $A=\$ 156.57, I=\$ 56.57$
e. $A=\$ 156.82, I=\$ 56.82$
4. a. $\$ 1631.02$
b. $\$ 4200.01$
5. a. $\$ 17449.40$
b. $\$ 45259.26$
6. a. $\$ 800$
b. $\$ 808.13$
c. The savings certificate by $\$ 8.13$
7. a. $\mathrm{A}=\$ 4,548.49$
b. $\$ 8250.97$
c. $\$ 14923.31$
d. 3.28 times
8. a. $\$ 5209.60$
b. $\$ 5428.00$
c. $\$ 5655.55$
d. Yes!

## Exercise 4

1. a. $\$ 74.41$
b. $\$ 2089.58$
c. $\$ 1542.17$
d. $\$ 565.48$
e. $\$ 958.53$
2. $\$ 5262.79$
3. a. $\$ 4787.84$
b. $\$ 15212.16$
4. a. $\$ 675.56$
b. $\$ 456.39$
c. $\$ 308.32$
d. check with your instructor

## Exercise 5

1. a. $8.30 \%$
b. $10.47 \%$
c. $12.68 \%$
d. $5.12 \%$
2. a. $10 \%$
b. $10.25 \%$
c. $10.38 \%$
d. $10.47 \%$
e. $10.51 \%$
f. $10.52 \%$
3. The effective rate of $8 \frac{3}{4} \%$ compounded monthly is $9.11 \%$ (the better deal) and the difference is $0.11 \%$.
4. $6.17 \%$

## Exercise 6

1. a.

| Date | Total amount from <br> previous year | Interest earned on <br> total amount | Annual deposit |
| :---: | :---: | :---: | :---: |
| Dec. 31/01 | - | - | $\$ 2000$ |
| Dec. 31/02 | $\$ 2000$ | $\$ 100$ | $\$ 2000$ |
| Dec. 31/03 | $\$ 4100$ | $\$ 205$ | $\$ 2000$ |
| Dec. 31/04 | $\$ 6305$ | $\$ 315.25$ | $\$ 2000$ |
| Dec. 31/05 | $\$ 8620.25$ | $\$ 431.0125$ | $\$ 2000$ |

| Jan. 1/06 | $\$ 11051.26$ |
| :--- | :--- |

b. $\$ 11051.26$ The answers should be the same.
2. a. $\$ 14486.56$
b. $\$ 6629.90$
c. $\$ 7971.96$
3. a. $\$ 1233.56$
b. $\$ 2543.20$
c. $\$ 6977.00$
d. $\$ 16387.93$
4. a. $\$ 49173.53$
b. $\$ 98347.06$
c. $\$ 196694.11$
d. $\$ 344214.70$
5. a. $\$ 118016.47$
b. $\$ 132683.33$
c. Monthly by $\$ 14666.87$
6. a. $\$ 498.00$
b. $\$ 19203.45$
7.

| Years | Annuity Amount |
| :---: | :---: |
| 20 | $\$ 57275.00$ |
| 25 | $\$ 98347.06$ |
| 30 | $\$ 164494.02$ |
| 35 | $\$ 271024.36$ |
| 40 | $\$ 442592.55$ |

8. The annuity is worth ( $442593 \div 57275$ ) almost 8 times more.

## Exercise 7

1. a. $\$ 81.44$ per month $\quad$ b. $\$ 629.48$ per year c. $\$ 372.80$ per quarter
2. $\$ 163.09$
3. $\$ 80.69$
4. 

| Years | Yearly Payment |
| :---: | :---: |
| 15 | $\$ 3147.38$ |
| 20 | $\$ 1745.96$ |
| 25 | $\$ 1016.81$ |
| 30 | $\$ 607.92$ |
| 35 | $\$ 368.97$ |
| 40 | $\$ 225.94$ |

5. $\$ 96.26$
6. $\$ 4143.65$

## Exercise 8

1. $P=\$ 89.79$ and $F . C .=\$ 77.48$
2. 

| Interest Rate | Monthly Payment | Finance Charge |
| :---: | :---: | :---: |
| $6 \%$ | $\$ 152.11$ | $\$ 475.96$ |
| $9 \%$ | $\$ 159.00$ | $\$ 724.00$ |
| $13 \%$ | $\$ 168.47$ | $\$ 1064.92$ |
| $19 \%$ | $\$ 183.28$ | $\$ 1598.08$ |

3. 

| Term of Loan | Monthly Payment | Finance Charge |
| :---: | :---: | :---: |
| 6 Months | $\$ 345.10$ | $\$ 70.60$ |
| 1 Year | $\$ 177.70$ | $\$ 132.40$ |

| 2 Years | $\$ 94.15$ | $\$ 259.60$ |
| :---: | :---: | :---: |
| 5 Years | $\$ 44.49$ | $\$ 669.40$ |

4. $P=\$ 76.62, F . C .=\$ 24.44$
5. a. $\$ 97.73$
b. $\$ 88$
c. $\$ 72.76$
d. the bank

## Exercise 9

1. a. $\$ 120000 \div 2 \frac{1}{2}=\$ 48000.00$
b. $10 \%$ of $\$ 120000=\$ 12000.00$
c. $\frac{1}{3}$ of $\$ 2000.00=\$ 666.67$
2. $P=\$ 620.24, F . C .=\$ 68857.60$
3. 

| Interest Rate | Monthly Payment | Finance Charge |
| :---: | :---: | :---: |
| $8 \%$ | $\$ 752.80$ | $\$ 90672.00$ |
| $10 \%$ | $\$ 868.52$ | $\$ 118444.80$ |
| $12 \%$ | $\$ 990.98$ | $\$ 147835.20$ |
| $14 \%$ | $\$ 1119.17$ | $\$ 178600.80$ |

4. 

| Length of Mortgage | Monthly Payment | Finance Charge |
| :---: | :---: | :---: |
| 15 years | $\$ 927.01$ | $\$ 66861.80$ |
| 20 years | $\$ 805.59$ | $\$ 93341.60$ |
| 25 years | $\$ 738.99$ | $\$ 121697.00$ |
| 30 years | $\$ 699.21$ | $\$ 151715.60$ |

5. $\$ 141.13$
6. a. $\$ 297.69$
b. $\$ 12222.73$
c. $\$ 57607.27$

## Exercise 10

1. a. $\$ 2000$
b. $\$ 100$
c. $9.00 \%$
2. $11.50 \%$
3. 12 month loan is at $10.25 \%$. 16 month loan is at $11.75 \%$.
4. $7.5 \%$
5. $16.00 \%$ The bank offers the best deal.

## Review Questions

1. Simple
2. Compound
3. $\$ 7.88$
4. $9.33 \%$
5. $\$ 4096.54$
6. $\$ 612.95$
7. $9.96 \%$
8. $\$ 3314.95$
9. $\$ 106.77$
10. $\$ 253.18$
b. $\$ 1164.48$
11. $11 \%$
12. a. $\$ 366.71 \quad$ b. $\$ 50010.40$

Notes

[^0]:    * There are other types of annuities. For example, if payments are made at the beginning of each time interval, the annuity is called an annuity due. In this unit, we will only be concerned with ordinary simple annuities.
